

PART C3: INTERVIEW PERFORMANCE SELF-REFLECTION

Candidate: Brian Sigei | Word Count: ~200 Words | Target: Board & Technical Defense

During the 30-minute mock executive and technical interview, I successfully articulated the strategic value proposition of the KEMSA Healthcare Supply Chain Intelligence Platform. Translating complex gradient boosting algorithms and Kimball star-schema architectures into CFO-relevant business metrics went exceptionally well. Grounding the business case in quantifiable figures—specifically the 2.6-month payback period, 359.8% Year 1 ROI, and KES 39.08M in recurring net savings—effectively established commercial viability and kept executive attention focused on bottom-line impact. Furthermore, structuring technical responses using the STAR method provided clear context on how class imbalance and localized redistribution constraints were systematically solved.

However, two areas require refinement. First, when cross-examined on data latency and offline clinic resilience, I initially leaned too heavily into technical pipeline details rather than leading with immediate operational risk mitigation protocols. Second, my delivery pacing during deep-dive machine learning explanations was slightly rapid, which could overwhelm non-technical board members.

Action Plan: For subsequent executive defenses, I will lead with a 15-second high-level business takeaway before diving into technical depth, enforce intentional pauses after presenting complex trade-offs, and utilize crisp visual analogies to explain model thresholding to mixed technical-executive panels.
